Restricted Rights Legend

If software is for use in the performance of a U.S. Government prime contract or subcontract, Software is delivered and licensed as "Commercial computer software" as defined in DFAR 252.227-7014 (June 1995), or as a "commercial item" as defined in FAR 2.101(a) or as "Restricted computer software" as defined in FAR 52.227-19 (June 1987) or any equivalent agency regulation or contract clause.

Use, duplication or disclosure of Software is subject to Keysight Technologies' standard commercial license terms, and non-DOD Departments and Agencies of the U.S. Government will receive no greater than Restricted Rights as defined in FAR 52.227-19(c)(1-2) (June 1987). U.S. Government users will receive no greater than Limited Rights as defined in FAR 52.227-14 (June 1987) or DFAR 252.227-7015 (b)(2) (November 1995), as applicable in any technical data.

Portions of this software are licensed by third parties including open source terms and conditions.

For detail information on third party licenses, see [Notice](#).

Contents

VEE uses binary arithmetic, which means that it presents numeric values which are an exact image of the number as it is stored inside the computer. As an example, set a REAL constant to the value 8.9972, and present that value into a To Printer object. The resulting printout will be 8.997199999999999. This printout may be misinterpreted as a numeric error.

This number is the full precision of the number as understood by VEE. It will not be exactly 8.9972 because VEE is approximating a decimal number with a binary number and an exact match will not occur unless the fractional part is an exact sum of quantities which are an inverse power of 2 -- $1/4$, $1/8$, $1/4 + 1/8$, and so on.

The reason it will be printed in this full-precision / no-roundoff format is because the default format on To Printer (and most other transaction objects) is: `WRITE TEXT A EOL --` which implies "standard format": a format that will accept any input, text or numeric, and pass it out as best it can.

If you want to print out a specific precision, set this to: `WRITE TEXT A REAL STD:6 EOL --` or whatever precision desired.

Some users observe that when they increase the precision of the Real Constant, they cannot input 8.9972 without it being extended to 8.997199. For this case, VEE is simply doing what it is told to do; not a problem, since the precision may be set to whatever is desired by the user.

This issue is not unique to VEE; it is common to any software that uses binary floating-point arithmetic. It is, however, much more visible in VEE than in C, because in VEE we get to see it happen. In C, however, we must print the data first, and that usually involves a formatted output.
